3. Risk

What is Reliability?

- “Reliability is the **probability** that an item of plant will perform its **duty** without **failure** over a designated **time**.”
- “Reliability is the **chance** of completing the mission.”
- “Reliability is the **chance** of success.”

All Work is a Series of Activities

$$\underline{R}_{\text{job}} = \underline{R}_1 \times \underline{R}_2 \times \underline{R}_3 \times \underline{R}_4 \times \underline{R}_5$$

All Your Machines are Parts in Series

$$R_{\text{system}} = R_1 \times R_2 \times R_3 \dots R_n$$

NOTE: R_n = Component reliability

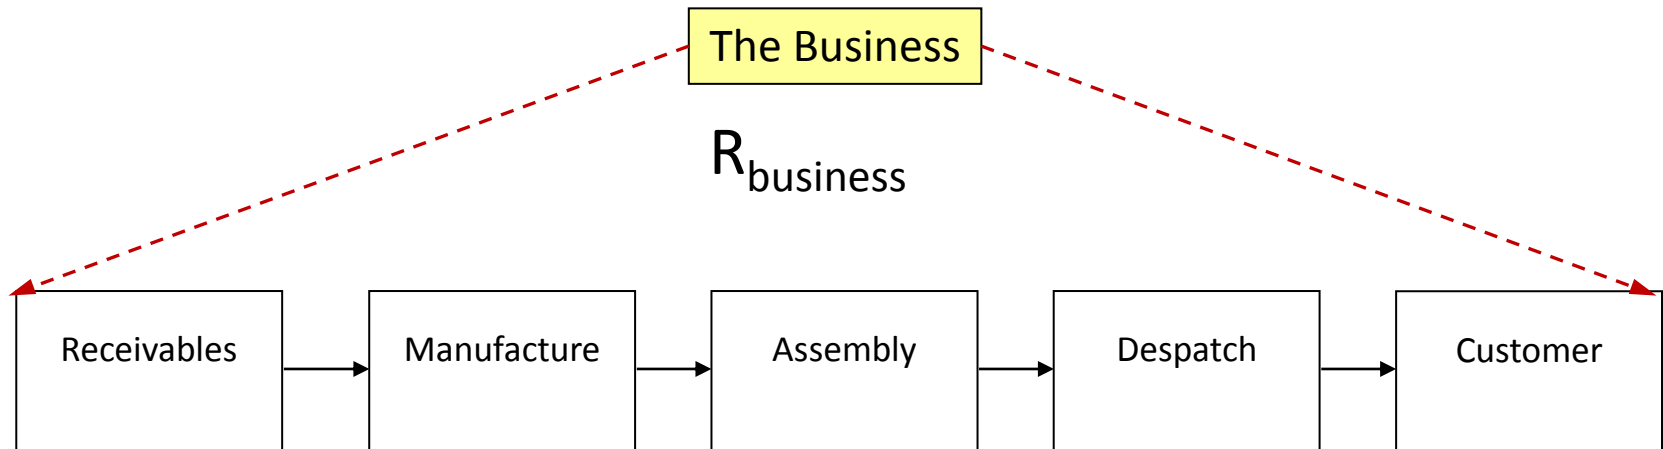

Reliability: the chance of success

1. For the motor to be highly reliable every bearing must be highly reliable.
2. For a bearing to be highly reliable each of its components must be even more reliable.
3. For every part to be reliable its design and operating health must be risk-free.

All Our Businesses are Processes in Series

$$R_{business} = R_{process1} \times R_{process2} \times R_{process3} \times \dots \times R_{process'n'}$$

Reliability Properties for Series Systems

The mathematics can be difficult. You won't need to do the math, but you need to know that such mathematics exists and be able to use the principles to optimise maintenance.

- Series Systems

$$R_{\text{system}} = R_1 \times R_2 \times R_3 \dots R_n$$

$$R = 0.95 \times 0.95 = 0.9025$$

Number of Components	Series System Reliability			
1	0.95	0.97	0.99	0.9999
2	0.9025	0.9409	0.9801	0.9998
4	0.8145	0.8853	0.9606	0.9996
6	0.7351	0.8330	0.9415	0.9994
8	0.6634	0.7837	0.9227	0.9992
10	0.5987	0.7374	0.9044	0.9990

Reliability Properties 1, 2, 3 for Series Systems

$$R_{\text{system}} = R_1 \times R_2 \times \dots R_n$$

Properties of Series Systems

1. *The reliability of a series system can be no higher than the least reliable component.*
2. *If 'k' more items are added into a series system of items (say 1 added to a system of 2, each with $R = 0.9$) the probability of failure of all items must fall an equal proportion (33%), to maintain the original system reliability.
($0.9 \times 0.9 = 0.93 \times 0.93 \times 0.93 = 0.81$)*
3. *A small rise in reliability of all items (say R of the three items rises 0.93 to 0.95, 2.2% improvement) causes a larger rise in system reliability (from 0.81 to 0.86, 5%).*

• Implications for Equipment made of Series Systems

- 1 System-wide improvements lift performance higher than local improvements. This is why Planning, SOP's, training and up-skilling pay-off.
- 2 Improve the least reliable parts of the least reliable equipment first.
- 3 Carry spares for series systems and keep the reliability of the spares high.
- 4 Standardise components so fewer spares are needed.
- 5 Removing failure modes lifts system reliability. This is why Root Cause Failure Analysis (RCFA) and Failure Mode and Effects Analysis (FMEA) pay off.
- 6 Provide pseudo-parallel equipment by providing tie-in locations for emergency equipment .
- 7 Simplify, simplify, simplify – fewer components means higher reliability.

Simplify, Simplify, Simplify

Carpenter's Creed: *measure twice, cut once*

1 error every 200 opportunities
~ 1 / wk

1 error every 4000 opportunities
~ 1 / 20 wk

$$\begin{aligned} R_{\text{parallel}} &= 1 - [(1 - R_1) \times (1 - R_2)] \\ &= 1 - [(1 - 0.995) \times (1 - 0.995)] \\ &= 0.999975 \end{aligned}$$

This is a 'mistake proofing' method that greatly reduces the chance of an error being made and left behind in a job as a defect that will later cause failure.

The Risks You Live With and those You Prevent Show Your Risk Boundary

If each failure costs your business \$7,000 – \$15,000 for every \$1,000 of repair cost ... what risk is the business willing to carry?

How often will a failure event be accepted?

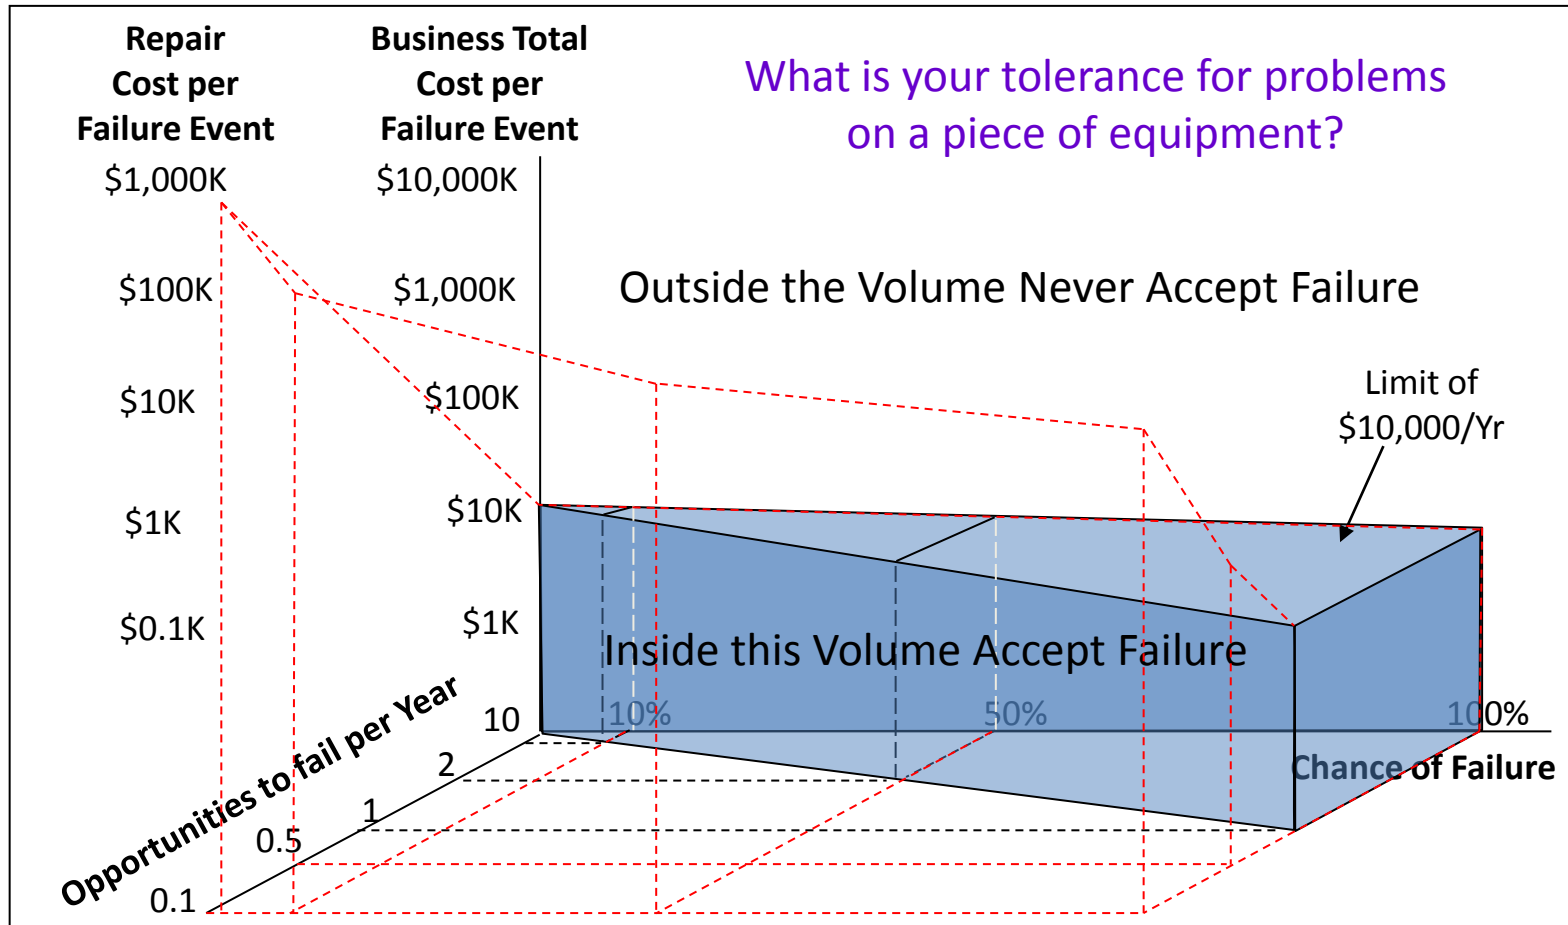

- What failures don't you bother repairing, but immediately replace with new? (The risks of using rebuilt equipment are too much.)
- Which production equipment will you let fail? (The cost of failure is insignificant.)
- Which production equipment will you never allow to fail? (The cost of failure is too expensive.)
- When will you be willing to replace equipment that you will not allow fail? (How much remaining life are you willing to give up to reduce the risk of failure?)
- What size safety and environmental failures will you allow? (Their cost is insignificant.)

Acceptable Failure Domain

Risk = Consequence x [Frequency of Opportunity x Chance of Failure at Each Opportunity]

Example of Using a Risk Boundary

Likelihood of Failure Event per Year			DAFT Cost per Event	\$30	\$100	\$300	\$1,000	\$3,000	\$10,000	\$30,000	\$100,000	\$300,000	\$1,000,000	\$3,000,000	\$10,000,000	\$30,000,000	\$100,000,000	\$300,000,000	\$1,000,000,000

Here are some opportunities...

All Our Businesses are Processes at Risk

$$\text{Risk}_{\text{process1}} + \text{Risk}_{\text{process2}} + \dots + \text{Risk}_{\text{process'n'}} = \text{Risk}_{\text{business}}$$

Measuring the Likely Risk Reduction from doing a Mitigation Activity

Likelihood/Frequency of Equipment Failure Event per Year				DAFT Cost per Event	\$30	\$100	\$300	\$1,000	\$3,000	\$10,000	\$30,000	\$100,000	\$300,000	\$1,000,000	\$3,000,000	\$10,000,000	\$30,000,000	\$100,000,000	\$300,000,000	\$1,000,000,000
Count per Year	Time Scale	Descriptor Scale			C1	C2	C3	C4	C5	C6	C7	C8	C9	C10	C11	C12	C13	C14	C15	C16
100	Twice per week			L13	H	H	H	E	E	E	E	E	E	E	E	E	E	E	E	E
30	Once per fortnight			L12	M	M	M	M	H	E	E	E	E	E	E	E	E	E	E	E
10	Once per month	Certain		L11	L	L	L	L	M	H	E	E	E	E	E	E	E	E	E	E
0.3	Once per quarter			L10					L	M	H	E	E	E	E	E	E	E	E	E
1	Once per year	Almost Certain	Event will occur on an annual basis	L9						L	M	H	E	E	E	E	E	E	E	E
0.3	Once every 3 years	Likely	Event has occurred several times or more in a lifetime career	L8							L	M	H	E	E	E	E	E	E	E
0.1	Once per 10 years	Possible	Event might occur once in a lifetime career	L7								L	M	H	E	E	E	E	E	E
0.03	Once per 30 years	Unlikely	Event does occur somewhere from time to time	L6									L	M	H	E	E	E	E	E
0.01	Once per 100 years	Rare	Heard of something like it occurring elsewhere	L5										L	M	H	E	E	E	E
0.003	Once every 300 years			L4											L	M	H	E	E	E
0.001	Once every 1,000 years	Very Rare	Never heard of this happening	L3												L	M	H	E	E
0.0003	Once every 3,000 years			L2													L	M	H	E
0.0001	Once every 10,000 years	Almost Incredible	Theoretically possible but not expected to occur	L1														L	M	H

Note: **Risk Level**

- Red = Extreme
- Amber = High
- Yellow = Medium
- Green = Low
- Blue = Accepted

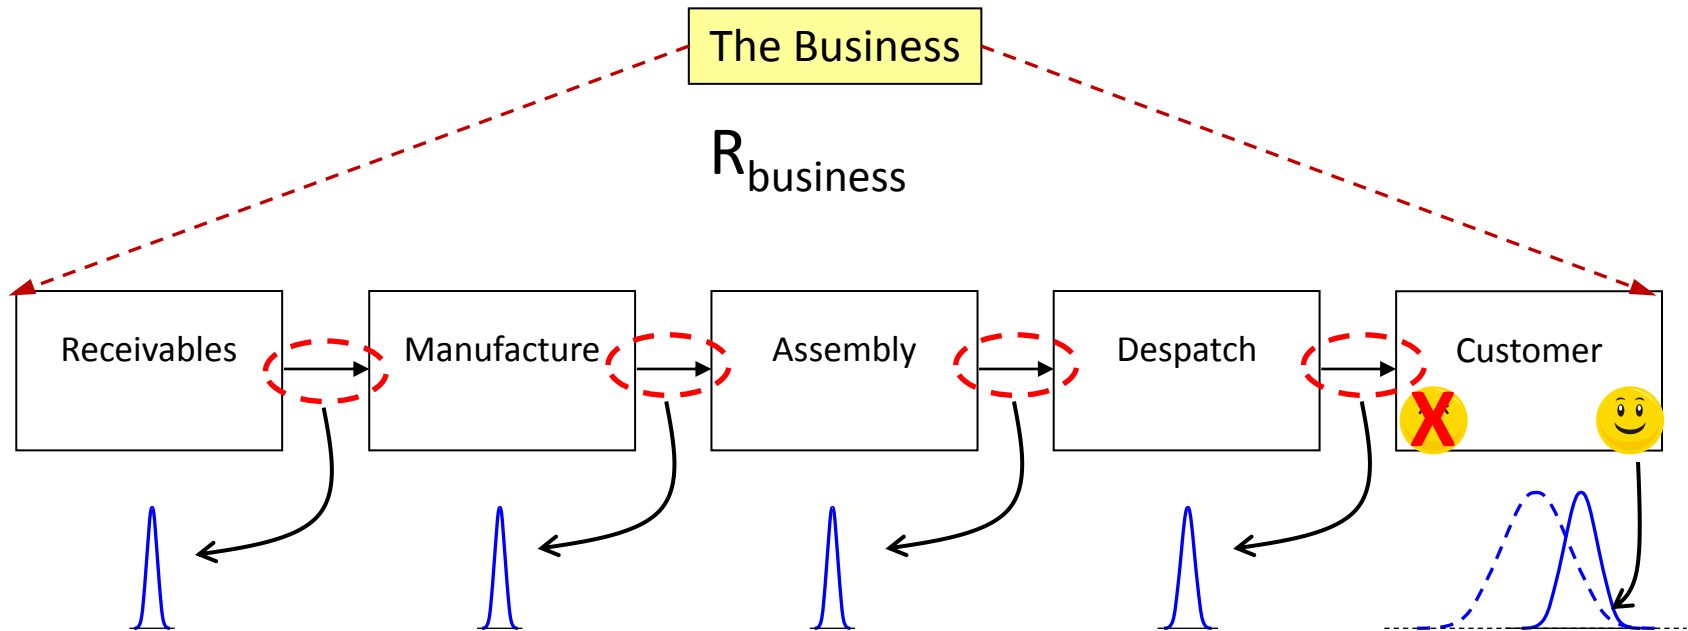

1) Risk Boundary is adjustable and selected to be at 'LOW' Level. Recalibrate the risk matrix to a company's risk boundaries by re-colouring the cells to suit.

2) Based on HB436:2004-Risk Management

3) Identify 'Black Swan' events as B-S (A 'Black Swan' event is one that people say 'will not happen' because it has not yet happened)

4) Low level is calibrated at \$10,000 per year per event

Reducing Businesses Process Risk

$$\text{Risk}_{\text{process1}} + \text{Risk}_{\text{process2}} + \dots + \text{Risk}_{\text{process'n'}} = \text{Risk}_{\text{business}}$$
